TO WHOM IT MAY CONCERN

Master Sachin Pariyar, 15-year-old resident of Gulmi had been repeatedly treated in this Institute for more than five years. He was previously diagnosed to have a congenital third ventricular cyst and underwent neurosurgery for the treatment of the condition. He was also diagnosed with central Diabetes Insipidus and was prescribed daily desmopressin. Unfortunately, he was not compliant to treatment advice and was repeatedly admitted in the past with different problems. This time he was admitted to hospital on 13<sup>th</sup> Poush 2081 with acute onset fever and shortness of breath along with seizure and alteration of sensorium. After admission, he was noted to have pneumonia along with multiple organ dysfunction (Acute kidney injury, Encephalopathy, Severe infection complicated by shock and disorder of blood causing excessive bleeding tendency). He was managed in PICU with respiratory support in a ventilator, multiple drugs to support his organ systems and also appropriate antibiotics. He required repeated blood and blood products transfusion due to bleeding from mouth and nose. On 5<sup>th</sup> day of his admission, he developed sudden onset severe bleeding from his lungs which resulted in severe and serious inadequacy of his oxygen needs that led to sudden cardiac arrest. Life support measures were attempted for prolonged period with multiple interventions but he could not be revived and succumbed to his illness on 18<sup>th</sup> Poush 2081 at 10:49 am.

May his soul rest in peace and may God give strength to the family to bear his loss.
